What's New in Alfabet 11.13.0

GA: September 2026

Consolidated Strategic Themes

Streamlined strategic initiatives for **agility**, **understandability** and **effective communication**

Alfabet 11.13.0 Release Highlights

Release Highlights:

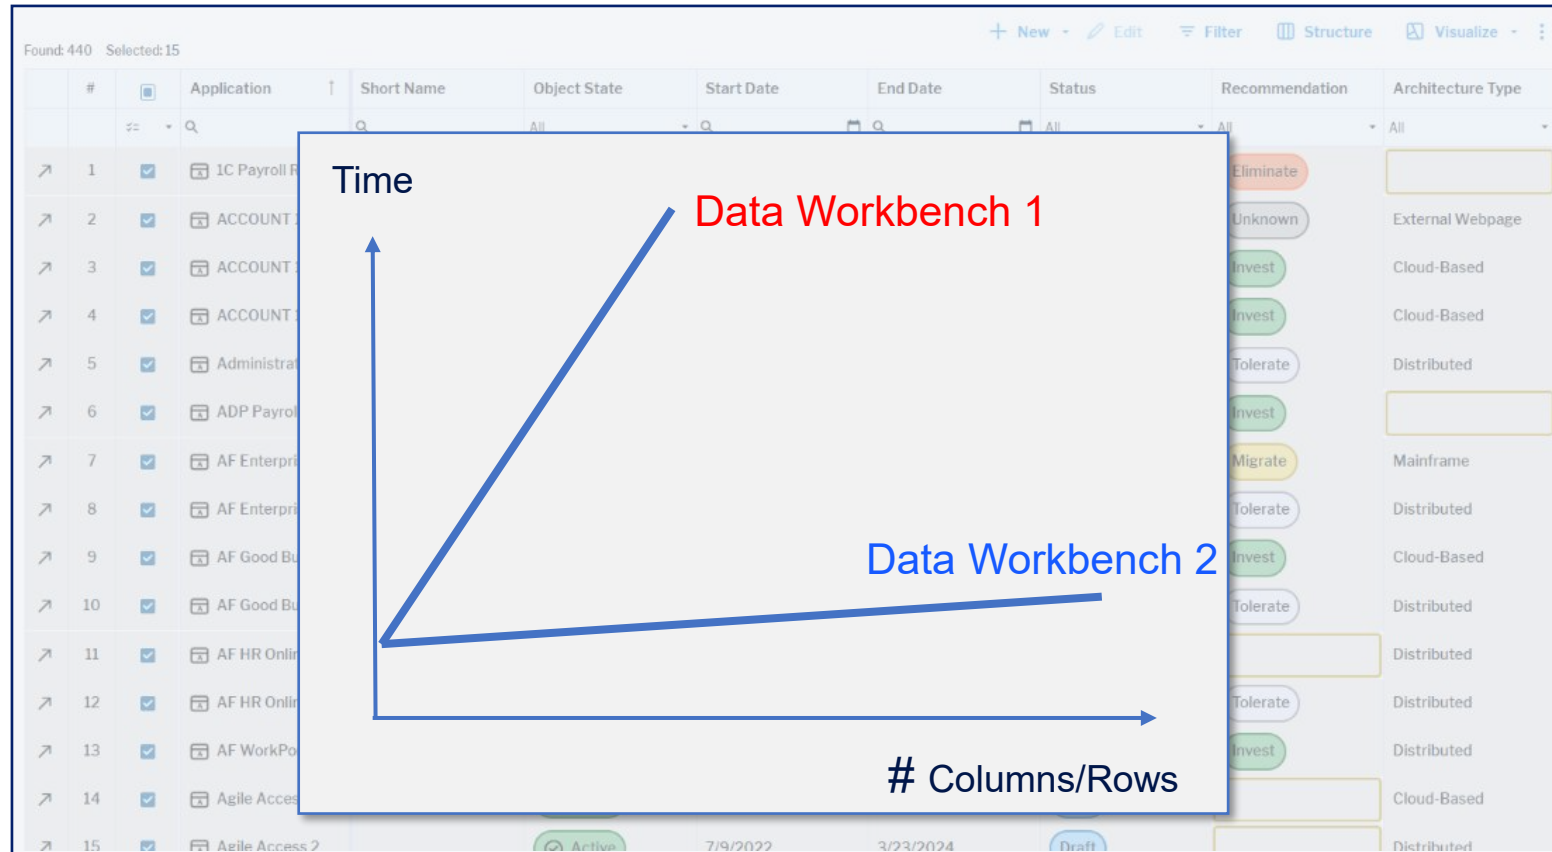

- Next-generation, high-performance Data Workbench 2
- MCP server for AI-driven search and analysis (Beta)
- Data-triggered actions for user-initiated changes
- Enhanced role type configuration and access management
- Editability conditions for class properties
- Ideas portal for strategic portfolio management

Faster data loads, efficient data updates, more responsive user experience

Next-generation, high-performance Data Workbench V2 (1)

- New with optimized memory and resource utilization accelerates performance across the entire application
- **Enhanced bulk update processing:** Higher performance and greater scalability for large object selections.
 - < 40 objects: bulk update editor
 - 41-300 objects: processing activity runs in background, users can continue to work
 - >300 objects: no bulk update, ADIF recommended
- **New object focus:** Focus in data workbench automatically shifts to newly created object

Faster data loads, efficient data updates, more responsive user experience

Next-generation, high-performance Data Workbench V2 (2)

[Recommendation] Is any of('Tolerate')

Confirm

?

You have selected 48 objects to update. This action will set the **Architect** attribute to **Alfons Alfabet** for the selected objects.

Related data quality rules, computed indicators, and data-triggered actions may be executed automatically and processed asynchronously.

Do you want to continue?

NoYes

Enhanced bulk update processing: If 41 to 300 objects are selected, a message is displayed describing the number of objects and extent of the changes that will be executed asynchronously.

Secure, standardized access to Alfabet portfolio data via Model Context Protocol (MCP)

MCP server for AI-driven search and analysis

- **Natural language search:** Query the Alfabet repository with natural language e.g., “Show all applications using Oracle Java” or “Find the most expensive projects.” AI interprets intent, not just keywords.
- **Context-aware discovery:** Uses metadata, relationships, field names, and descriptions to deliver accurate, meaningful search results beyond simple text matching
- **Search across multiple sources:** MCP unifies information from object metadata, field descriptions, documentation, system configurations, and dependencies into one powerful search experience
- **Insightful result summaries:** AI-generated explanations clarify what each result means and why it matters
- **Faster decision-making:** Real-time access reduces time spent searching. Teams can focus on understanding, improving, and governing their data
- **Secure access:** MCP server is read-only, no modifications to repository data allowed. Access restricted to users with explicit permission for relevant REST services.

Good to know:

- User portfolio data from Alfabet is never used to train AI services.
- Option to opt out from using the AI service altogether.

Show me top 5 applications that belong to John Customer

I'll search for applications where John Customer is associated with them. Let me find those for you.

Used alfabet integration >

Let me try a broader search. The responsible user might be stored differently. Let me search by name field instead:

Search Alfabet Objects >

I can see the applications, but I need to find out who "John Customer" is. Let me check the user references I see in the results. I notice responsibleuser values like 273-8-0, 273-3-0, etc. Let me look up one of these to understand the user structure:

Get Alfabet Objects by REFSTR >

Perfect! I found John Customer with REFSTR 273-8-0. Now let me search for applications where he is the responsible user:

Search Alfabet Objects >

Perfect! Here are the top 5 applications that belong to John Customer (REFSTR: 273-8-0):

Top 5 Applications - John Customer

1. Mafo-Portal (APP-6)

- Status: Approved, Retired
- Architecture: Mainframe
- End Date: 2027-07-02
- Recommendation: Migrate
- Data Quality Score: 96

2. SAP@AI (APP-10)

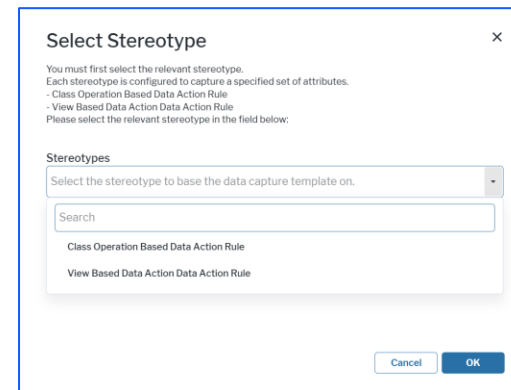

- Status: Trash, Retired
- Architecture: Client-Server
- End Date: 2021-09-29
- Recommendation: Invest
- Data Quality Score: 96

Efficient automation for change-triggered next steps

Data-triggered actions for user-initiated changes

Two new stereotypes for data-triggered action rules:

- **View-based data action rule in standard views:** execution of data-triggered actions in response to button and inline editing interactions.
- **Operation-based data action rule:** for existing data action rules in data workbenches and content areas.

Select Stereotype

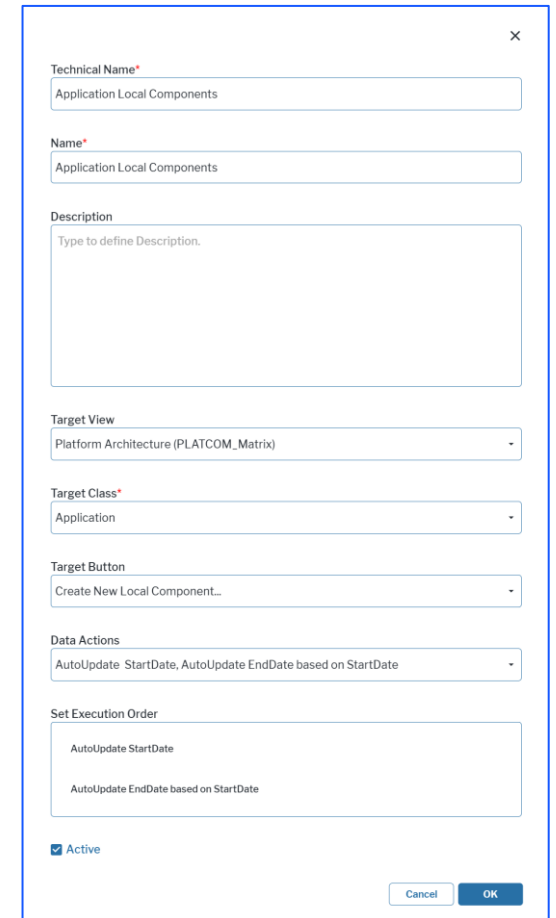

You must first select the relevant stereotype.
Each stereotype is configured to capture a specified set of attributes.
- Class Operation Based Data Action Rule
- View Based Data Action Data Action Rule
Please select the relevant stereotype in the field below:

Stereotypes
Select the stereotype to base the data capture template on.

Enhanced role type configuration and access management

- Override Role Type settings with **Class Settings** to adapt system behavior to specific combinations of object classes and user profiles
- Define editing and visibility **conditions** for roles for more granular access control
 - based on property values of the object for which the role is defined
 - based on characteristics of individual users

Define the Role Types that are valid for a specific class e.g., here for Applications

Define conditions that determine whether a role is editable or visible alongside general editability and visibility settings.

Good governance using dynamic control of property editability based on context, rights, or process state

Editability Conditions for Class Properties

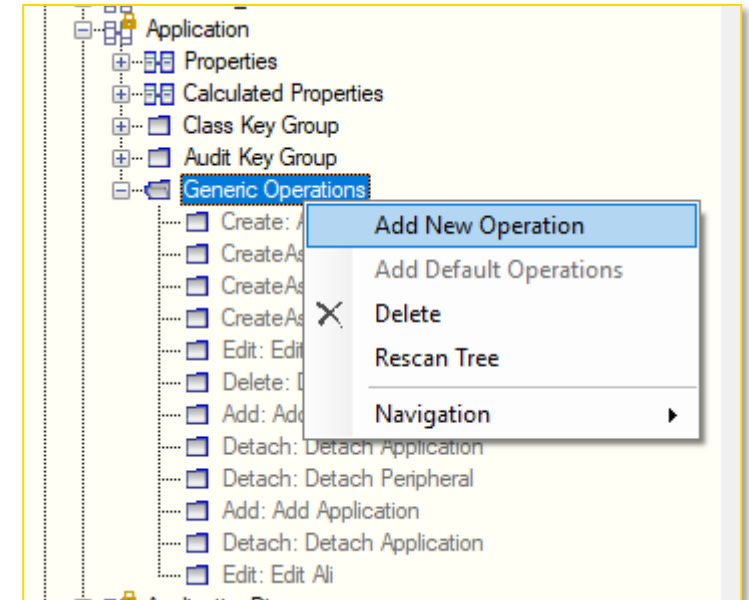

- Define editability conditions in class settings using the **new Editability Conditions attribute** in the object class property configuration
- Grant or deny users permission to edit data based on criteria such as their role for an object or their membership in a user group
- Use Conditions to make a property read-only depending on the value of another object class property

The screenshot shows the configuration window for 'SAG_Devices [WriteAccess]'. The window has a toolbar with icons for a list, a plus sign, a key, a lightning bolt, and a document. The configuration is organized into sections: 'Common', 'Conditions', 'Selector Configuration', and 'Value Range Definition'. The 'Editability Conditions' attribute under the 'Conditions' section is highlighted with a blue border.

Range as Native SQL Query	

Extensions to generic operations

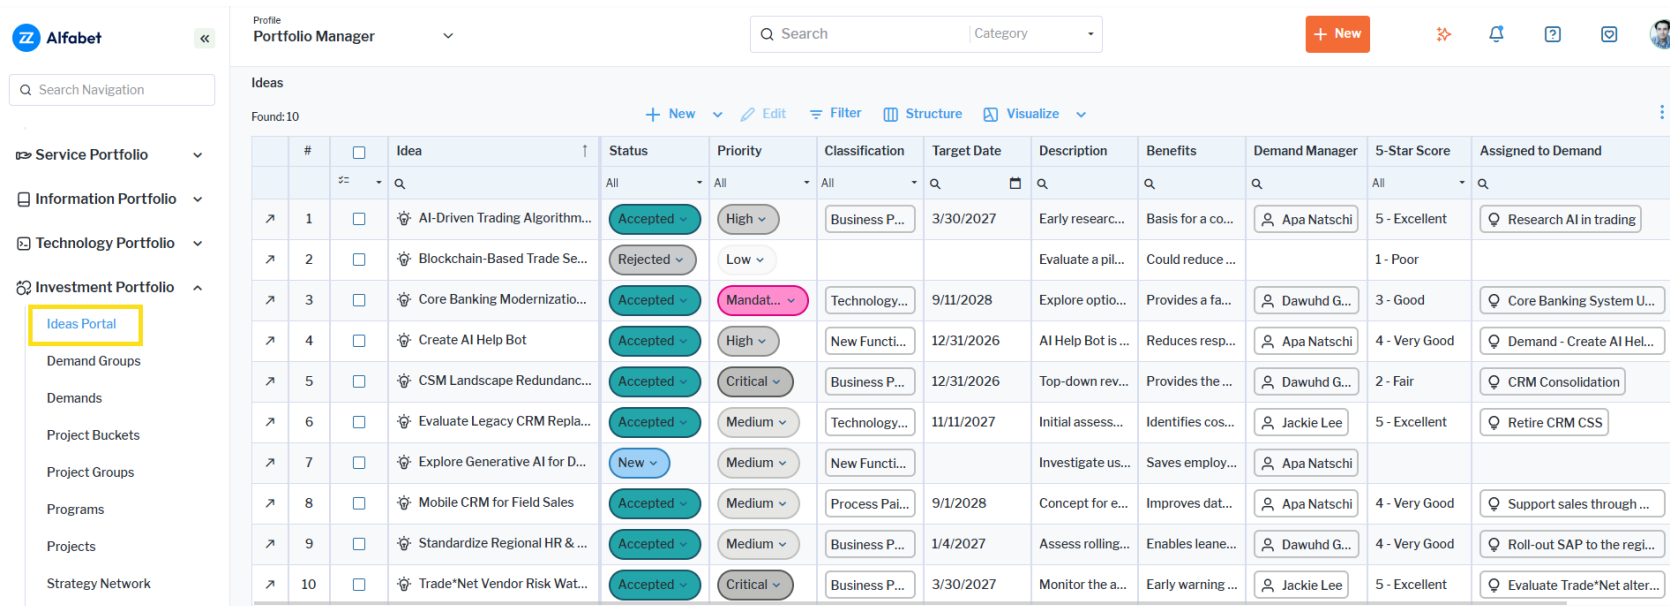

- Configure buttons for the user interface for creating copies, versions, and variants of objects for any class using the **new generic operation type “Create As Copy”**
- “Create as Copy” determines which object properties and relationships are transferred from the source object to the new object. Update source object property values from the target object during the copy process e.g., when creating a new version of an object, update the original object to reference the new version.
- Flexibly handle relationships to other objects:
 - Copy relationships by creating equivalent references from the new object to the existing related objects.
 - Copy related objects and automatically establish relationships between the copied objects and the newly created objects.

Document, assess, and prioritize opportunities before committing to the full demand management process

Ideas portal for strategic portfolio management

- Supports early-stage innovation, demand intake process and understanding of a demand's evolution
- Capture ideas in the Data Workbench via Investment Portfolio > Ideas Portal
- Collect ideas from various sources
- Assign key information: priority, target date, benefits of the ideas
- Have users rate ideas
- Create a demand based on an idea, allowing it to seamlessly enter the standard planning and execution lifecycle
